# Final Task – AWS Infrastructure Provisioning Using Terraform

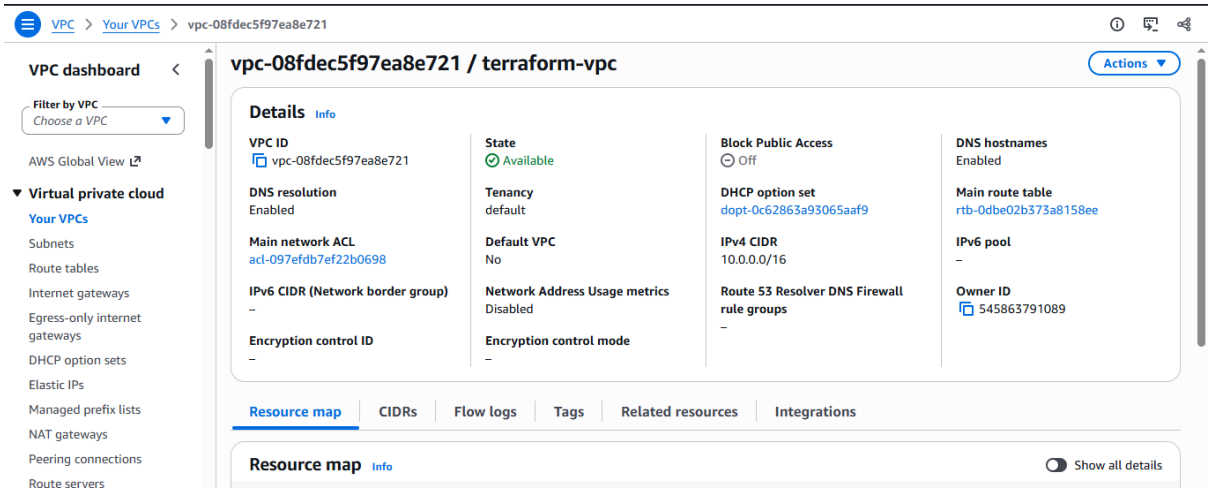

## Documentation points:

1. Created a custom VPC using Terraform.
2. Created and attached an Internet Gateway to the VPC.
3. Created a custom Route Table.
4. Configured a default route (`0.0.0.0/0`) to the Internet Gateway.
5. Created a public subnet inside the VPC.
6. Associated the subnet with the custom Route Table.
7. Created a Security Group allowing SSH (22), HTTP (80), and HTTPS (443).
8. Created a Network Interface with a private IP address.
9. Allocated and associated an Elastic IP with the Network Interface.
10. Launched an Ubuntu EC2 instance using Terraform.
11. Installed Apache2 using EC2 User Data.
12. Enabled and started the Apache2 service.
13. Configured Apache to display a custom welcome page.
14. Verified the EC2 instance and networking resources in AWS Console.
15. Accessed the Apache web server using its Elastic IP address.
16. Used Terraform outputs and state commands to verify deployed resources.

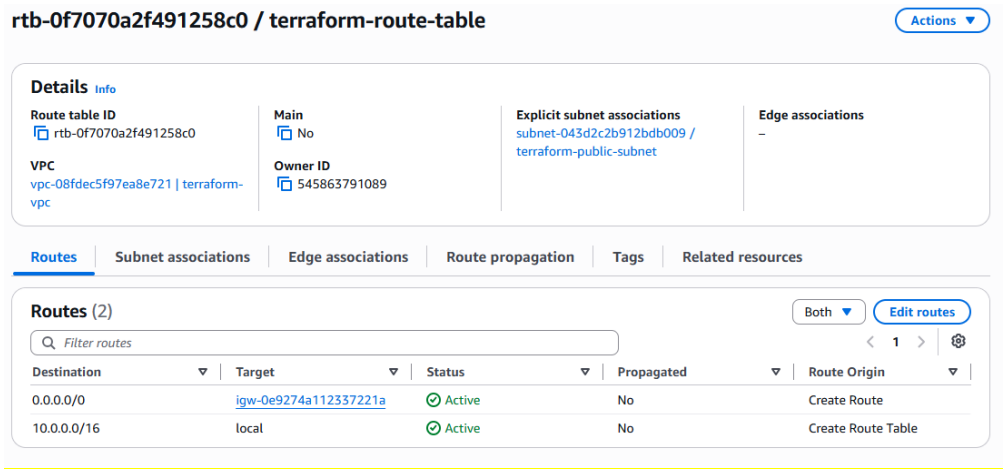

## Ec2

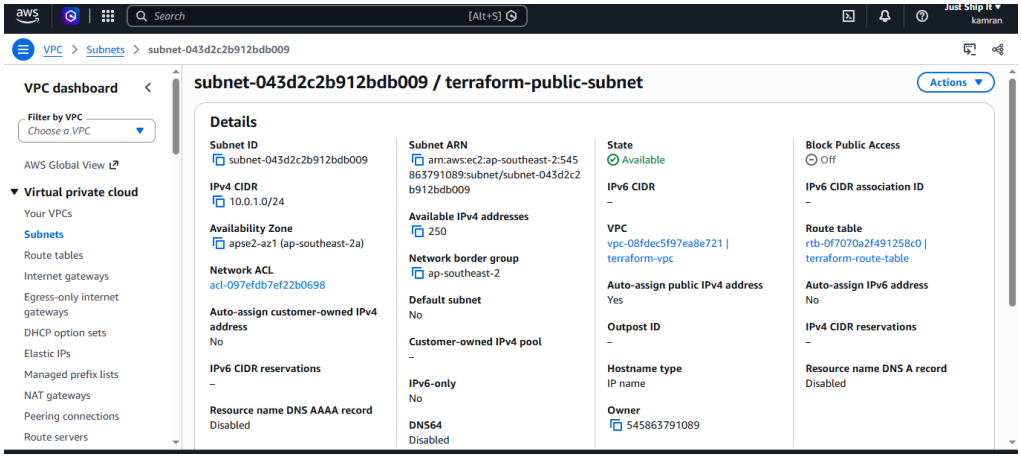

# Vpc

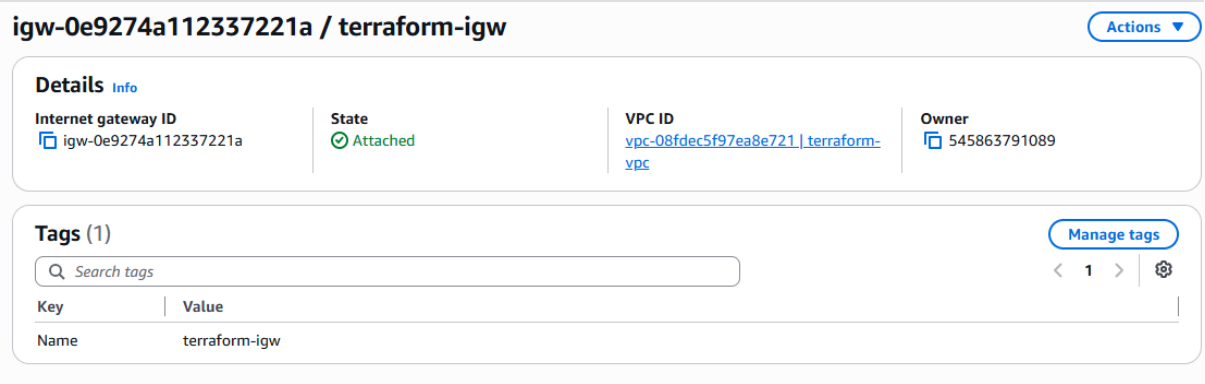

# Route table

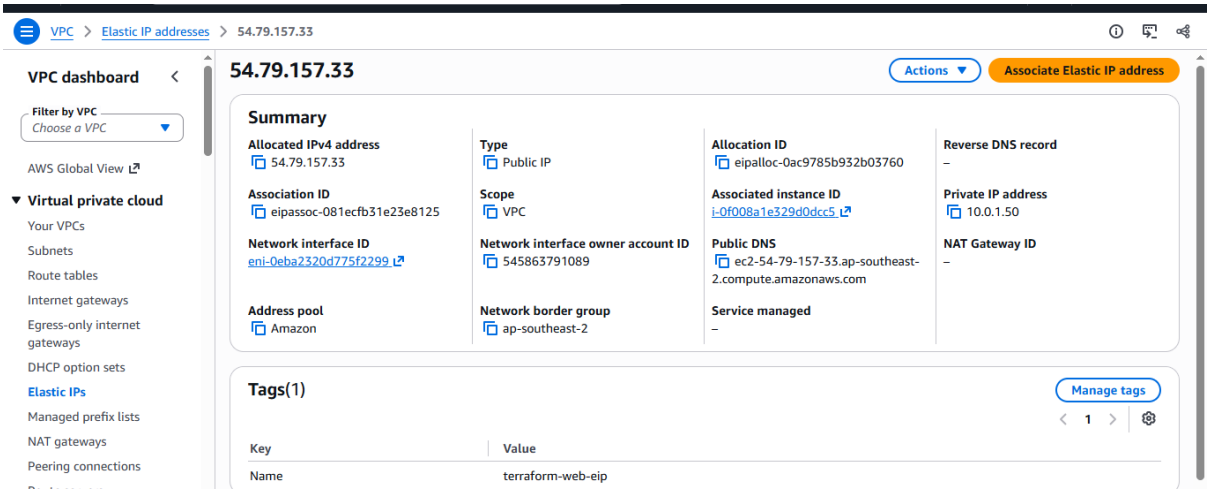

# Subnet

## Internet gateway

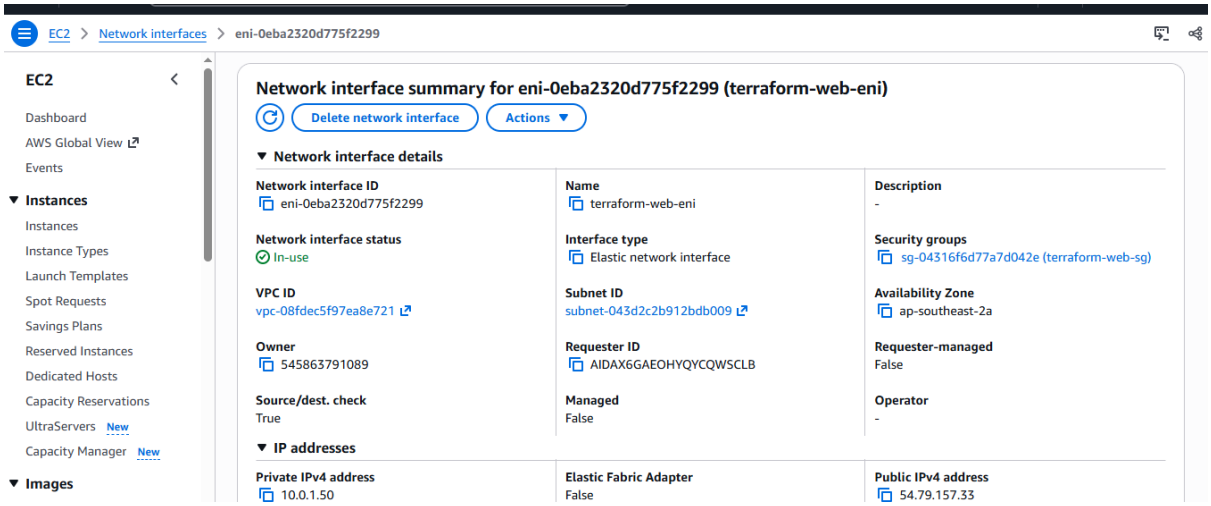

## Elastic ip

## Apache webpage in browser

# Network Interface

# Security Group
